* **GIMP** is a free open source software program similar to Photoshop. * **NON-PROFESSIONAL USES:** The average photographer or videographer should be able to get by with Photoshop Elements. # CREATING YOUR FIRST BASE PHOTO It's easy to open a photo in Photoshop and start creating new images, but it's often more helpful to start with a blank page (known in Photoshop as a _Canvas_) or open

an existing file to start your new design. This tool is particularly helpful when you're trying to get a feel for something that's new to you. It can be a lot like teaching someone to drive on the highway. You start from a plan, and you continue without much direction, testing whether or not what you're learning agrees with you. And when you begin a new project, it's easier to get a feel for the new program if you're starting from a clean canvas. In a web design situation, you might start with an empty page: a _page that has no existing visual element,_ and instead is covered in a solid color for the beginning of your web page design project. In this example, you'll be creating a graphic

illustration that, once finished, will create a background for a web page. You'll be drawing in the areas that will eventually become filled with text. To begin the first steps in your project, open a new file. Choose File⇒New or press the key on your keyboard. On the left side of the Photoshop window, you'll see a dialog box titled New. Click the dialog box to open it. Choose Blank Document, and then click the OK button (see Figure 14-1). Your new page is created. **Figure 14-1** A new blank page (with a solid color fill) ready to be used as the base image in your web page design. You'll notice that the Document Properties dialog box (see Figure 14-2) opens. You'll use this dialog

box to change the settings for the page you just created. **Figure 14-2** Modifying settings for your blank page document. In the Document Properties dialog box (Figure 14-2), you can set page dimensions, page attributes, and a few other settings; in this example, you need only one setting, which is the color of the page. From the Color pop-up menu, choose White (#FFFFFF

Although we might often think of Photoshop as the only tool in a graphics designer's toolkit, it is in fact just one of many that designers will find useful. You can add powerful

tools to your workflow even if you don't use Photoshop. For example, you may be able to get just as good results editing images in InDesign or Illustrator. Designers create images as part of their job; indeed, in the graphic design world, it's often said that "good design is seen, not just felt." Still, it's not always easy to explain why an image is "good." As designers, we probably think we're more objective than we actually are. Sometimes, our own interpretation of a design is what makes a design successful. In this class, we'll be talking about new features that are designed to make your work more efficient and streamline your workflow, while at the same time making it more enjoyable. I'll also

talk about steps you should be taking when designing images that you're going to create in Photoshop. Contents Why Photoshop? While you might be thinking, "But I don't do any graphic design, why should I be using Photoshop," Photoshop is one of the most popular graphic design tools around. And when we consider the amount of Photoshop power we actually use, the amount is actually rather small. The features, tools, and customizations we use in Photoshop are what makes it such a powerful tool for graphic design. We use it to create works of art, create logos, create both color-based and design elements, and even to make photoshopped ads for branding. If you have a lot of original content,

then the Resize function in Photoshop Elements is a superb tool to use; at a minimum, it can save you a lot of time. It's also a great way to put a quick, neat finish on your photos. In this class, we'll be spending most of our time using the Resize function to either reduce or enlarge images. If you just have a few photos to edit, then the Smart Filters function can also help speed up the process. This powerful set of filters allows you to quickly change the appearance of your images with just a few clicks of a button. The type of images you work on can have a big 388ed7b0c7

Q: Can't compile C++ code with Boost on VS2013 I have found this bug here As I am a noob in VS2013 and boost, I don't know what I should do to fix my compiler, can someone

help me please? A: The particular issue you reference has already been fixed in the boost-1.55.0 release. The boost.org release notes indicate the fix was released on 2013-04-12. If you are using the msvc.com 2013 redistributable package then the fix was available on 2013-04-02. If you have the update installed the fix should be made available to your IDE. 1. Field of the Invention The present invention relates to a method of driving a plasma display panel, and more particularly, to a method of driving a plasma display panel utilizing interlaced driving technology for reducing a flicker on a screen. 2. Discussion of the Related Art Generally, a plasma

display panel (hereinafter, referred to as a "PDP") is a display device for generating visible light from ultraviolet rays generated by collision of electrons and gas molecules. A PDP includes a plurality of discharge cells disposed in a matrix type configuration for displaying an image. Each of the discharge cells include a phosphor layer which will generate visible light when excited by collision of electrons and phosphor molecules generated by discharge. The plurality of discharge cells arranged in a matrix are driven using subfields. For example, an n-bit display data is converted into an m-bit digital data having the "2m" level, such that the m-bit digital data

is applied to an address electrode during the time of a "m"-th subfield. A discharge cell supplied with an address pulse for a predetermined period is turned on, and visible light is generated by discharge. At a predetermined time, sustain pulses are alternately applied to an address electrode and a scan electrode for discharging during a sustain period until the address electrode voltage drops to a sustain discharge starting voltage. During this time, a discharge cell supplied with an address pulse corresponding to a predetermined subfield is turned on. Then, in the succeeding subfield, address discharge is generated using the scan voltage and data voltage applied from a scanning

electrode and an address electrode, respectively. Thus, a predetermined discharge is generated. However
